THE GUT HEALTH BLUEPRINT

Five practical secrets to fix your digestion, beat the bloat, and actually absorb what you eat — so your training and nutrition finally pay off.

BY TYRONE HAYES · RIPPED CITY INC

START HERE

YOUR GUT IS THE ENGINE

You can eat the cleanest diet on the planet, but if your gut isn't breaking it down and absorbing it, you're leaving results on the table — energy, muscle, recovery, and a flat, comfortable stomach.

This isn't about fear, cleanses, or expensive powders. It's five simple shifts, each backed by how digestion actually works, that most people never get taught. Read it once, run the 7-day reset at the end, and keep what works. That's the whole plan.

HOW TO USE THIS

Don't try all five at once. Pick the one secret that sounds most like your problem, run it for a week, then add the next. Small, stacked wins beat a total overhaul you can't sustain.

SECRET 01

1. DIGESTION STARTS BEFORE YOU SWALLOW

Most "gut problems" are really **speed problems**. You eat fast, barely chew, and dump big chunks of food into a stomach that isn't ready. Then you blame the food.

- ✓ **Chew until it's liquid.** Aim for 20–30 chews a bite. Digestion of carbs literally begins in your mouth.
- ✓ **Sit down and slow down.** Give a meal 15–20 minutes. Eating on the move keeps you in "stress mode," which shuts digestion down.
- ✓ **Take 3 slow breaths before you eat.** It flips you into "rest-and-digest" so your gut actually shows up to work.

Why it works: chewing and a calm nervous system trigger stomach acid and enzymes. Skip that step and everything downstream — breakdown, absorption, comfort — suffers.

SECRET 02

2. BEAT THE BLOAT AT THE SOURCE

Bloat isn't random. It's almost always **gas, water, or timing** — and it's fixable once you find your trigger instead of guessing.

- ✓ **Ramp fiber, don't slam it.** Going from low to high fiber overnight ferments hard and bloats you. Add ~5g every few days and let your gut adapt.
- ✓ **Hydrate with the fiber.** Fiber needs water to move. More fiber + not enough water = a traffic jam.
- ✓ **Find your top offenders.** The usual suspects: sugar alcohols (sorbitol, xylitol in "diet" snacks), carbonated drinks, and eating too fast (you swallow air). Cut one for a week and watch.
- ✓ **Walk after meals.** A 10-minute walk moves gas through and blunts the blood-sugar spike at the same time.

Why it works: most day-to-day bloat is trapped gas from fermentation and swallowed air — not "a slow metabolism." Control the inputs and it settles.

SECRET 03

3. ABSORB WHAT YOU EAT

You're not what you eat — you're what you **absorb**. High-protein, nutrient-dense food only counts if it makes it into you.

- ✓ **Don't drown your dinner.** A big glass of water *during* a meal can dilute the acid you need. Sip if thirsty; hydrate mostly between meals.
- ✓ **Pair for absorption.** Fat-soluble vitamins (A, D, E, K) need fat — put olive oil on the salad. Vitamin C boosts iron from plants — squeeze lemon on the greens.
- ✓ **Prioritize protein at every meal.** Spreading protein across the day beats one giant hit — you use more of it for muscle and recovery.
- ✓ **Try bitters or apple cider vinegar before heavy meals.** A little (1 tsp ACV in water) can nudge stomach acid if you tend to feel "brick in the stomach" full.

Why it works: absorption depends on acid, enzymes, and the right pairings. Support those and the same food gives you more.

4. FEED YOUR MICROBIOME

Trillions of gut bacteria help digest food, make vitamins, and steady your mood and cravings. They eat what you eat — so **feed the good ones**.

- ✓ **Chase plant diversity, not just quantity.** Aim for 30 different plants a week — veg, fruit, beans, nuts, seeds, herbs, spices all count. Variety feeds a wider, more resilient microbiome.
- ✓ **Add a daily fermented food.** Yogurt with live cultures, kefir, sauerkraut, kimchi — a spoonful a day, built up slowly.
- ✓ **Give them prebiotics.** Onion, garlic, oats, green banana, and asparagus are fuel for good bacteria.
- ✓ **Dial back the ultra-processed stuff.** Emulsifiers and a flood of artificial sweeteners can disrupt the balance. You don't need perfect — just less.

Why it works: a diverse, well-fed microbiome is linked to better digestion, steadier energy, and fewer cravings. Diversity of plants is the single biggest lever.

SECRET 05

5. RUN THE DAILY GUT ROUTINE

None of this matters if it lives in a PDF. Here's the entire protocol on one page — repeatable, boring, effective.

- ✓ **Morning:** Big glass of water first thing. Protein + fiber breakfast (not just coffee).
 - ✓ **Every meal:** Sit, breathe x3, chew to liquid, hydrate between not during.
 - ✓ **After meals:** 10-minute walk when you can.
 - ✓ **Daily:** One fermented food, aim for a new plant you didn't eat yesterday.
 - ✓ **Evening:** Stop eating ~2–3 hours before bed so your gut can rest and repair overnight.
-

DO THIS FIRST

THE 7-DAY GUT RESET

One small action a day. By the end of the week you'll have run every secret at least once — and you'll know which ones your body responds to.

DAY1	Chew every bite to liquid. That's it. Notice how full you feel on less.
DAY2	Take 3 slow breaths before each meal and put the fork down between bites.
DAY3	Move hydration between meals, not during. Add a 10-min walk after dinner.
DAY4	Cut one bloat trigger (sugar alcohols, soda, or eating fast). Note the difference.
DAY5	Add a fat to your veggies and protein to every meal. Absorb more of what you eat.
DAY6	Eat one fermented food + count your plants. Try to hit 10 different ones today.
DAY7	Run the full Daily Gut Routine start to finish. This is your new baseline.

KEEP WHAT WORKS

You won't need all of it forever. Keep the 2–3 habits that made the biggest difference for *you* and let them run on autopilot. That's how real change sticks.

READY TO STOP GUESSING?

This is the free version. Inside Ripped City Coaching, I build the whole thing around *your* biology — nutrition, training, and gut protocols tailored to your labs, goals, and schedule.
